

Lab 6

Requirements

Implement the functions corresponding to the LR(0) parsing algorithm.

- Closure
- GoTo
- CanonicalCollection

```

classDiagram
    class Grammar {
        canonicalCollection() List<List<LRItem>>
        closure(LRItem) List<LRItem>
        getProductionsFor(String) List<Production>
        goTo(List<LRItem>, Element) List<LRItem>
        read(InputStream) void
        CFG boolean
        nonTerminals Set<NonTerminal>
        productions List<Production>
        terminals Set<Terminal>
    }
    class LRItem {
        production Production
        dotPosition int
        equals(Object) boolean
        firstAfterDot() Element
        hashCode() int
        toString() String
    }
    class Production {
        sourceElements List<Element>
        resultElements List<Element>
        equals(Object) boolean
        hashCode() int
        toString() String
    }
    class Element {
        value String
        equals(Object) boolean
        hashCode() int
    }
    class Epsilon {
        toString() String
    }
    class NonTerminal {
        toString() String
    }
    class Terminal {
        toString() String
    }
    Grammar <|-- LRItem
    Grammar <|-- Production
    LRItem <|-- Element
    Production <|-- Epsilon
    Production <|-- NonTerminal
    Production <|-- Terminal
  
```

Grammar

- canonicalCollection() List<List<LRItem>>
- closure(LRItem) List<LRItem>
- getProductionsFor(String) List<Production>
- goTo(List<LRItem>, Element) List<LRItem>
- read(InputStream) void
- CFG boolean
- nonTerminals Set<NonTerminal>
- productions List<Production>
- terminals Set<Terminal>

LRItem

- production Production
- dotPosition int
- equals(Object) boolean
- firstAfterDot() Element
- hashCode() int
- toString() String

Production

- sourceElements List<Element>
- resultElements List<Element>
- equals(Object) boolean
- hashCode() int
- toString() String

Element

- value String
- equals(Object) boolean
- hashCode() int

Epsilon

- toString() String

NonTerminal

- toString() String

Terminal

- toString() String

```
void read(InputStream input)
```

- ```
boolean isCFG()
```

- Checks if each production has exactly one non-terminal symbol as source
- Returns:
  - True - the grammar is CFG
  - False - the grammar is not CFG

List<LRItem> closure(LRItem item)

- Generates the closure of an input production
- Recursively calls itself on each production in order to generate the complete collection (ignores duplicates)

List<LRItem> goto(List<LRItem> state, Element element)

- Computes the state generated by the goto LR function.
- Takes the state productions where the symbol after the dot is equal to the input element, shifts the dot one position to the right, and computes the closure of each resulting production
- Parameters:
  - state - the goto input state for the goto LR function
  - element - the input symbol for the goto LR function

List<List<LRItem>> canonicalCollection()

- Computes the canonical collection of the grammar
- The resulting collection is represented by a list of states
- Generates a starting production ( $S' \rightarrow .S$ ) and recursively calls goto on each valid combination of states and symbols until all states are generated

## Production class

Contains a list of source symbols (Element) and a list of result symbols

## LRItem class

Encapsulates a Production object and also holds the dot position.

# Design Details

- A state is represented by a collection of LRItems (where LRItems are productions with dots).
- Classes Element, Terminal, NonTerminal, which just encapsulate strings were used in order to make it easy to determine if a symbol is a terminal or a non terminal, in conjunction with using double quotes (") in input files to denote terminal symbols;
- A Grammar contains a set of terminals, another one for nonterminals, and a list of productions; the first symbol of the first production (as entered in the input file) is considered to be the starting symbol;
- There is a reserved character ("\$\$") for denoting  $\epsilon$  in the input file;
- "::=" is used as a separator between a production's left side and right side, and a space is used to separate symbols

# Implementation

Github url: <https://github.com/darius-calugar/flcd-parser-1/tree/Lab6>

# Tests

Tests were ran on the following inputs:

## Test 1

```
E ::= E "+" T | T
T ::= T "*" F | F
F "a" ::= "(" E ")" | "a"
```

## Test 2

```
program ::= compdStmt
type ::= "integer"|"string"|userType|arrayType
arrayType ::= type "list"
userType ::= "identifier"
var ::= "identifier" | "identifier" "of" var | var "at" "const"
expression ::= numExpression|"const"
numExpression ::= expression operator expression|var|"const"
condition ::= expression relation expression
operator ::= "plus"|"minus"|"times"|"divided"|"mod"
relation ::= "smaller"|"larger"|"is"
def ::= "define" userType
declStmt ::= type "identifier"
declListStmt ::= arrayType "identifier"
stmt ::= compdStmt|assignStmt|ioStmt|ifStmt|declStmt|declListStmt|stopStmt
stmts ::= $ | stmt stmts
compdStmt ::= "begin" stmts "end"
assignStmt ::= var "becomes" expression
ioStmt ::= readStmt|printStmt
readStmt ::= "read" var
printStmt ::= "print" expression
ifStmt ::= "if" condition "then" stmt | "if" condition "then" stmt "else" stmt
loopStmt ::= "each" var "from" numExpression "to" numExpression stmt
stopStmt ::= "stop"
```
